

Data Warehousing and Data Mining (OLAP) for Accessing Archived Databases: A Case Study of the US 1880 Census

Richard Healey

Dept. of Geography

University of Portsmouth

The NAPP Dataset

- Approx. 53 million individual person records are available from the US 1880 census
- Downloadable in bulk from the NAPP website
- Individual details of name, place of birth, age, occupation, parental birthplaces etc.
- Most fields converted to numeric codes
- First pilot - 164,000 heavy industrial workers chosen for the 67 counties of Pennsylvania
- Second ‘industrial strength’ data warehouse – 5.27 million records - entire male population of five states in the NE USA
- Recent transfer to supercomputer - enlargement under consideration

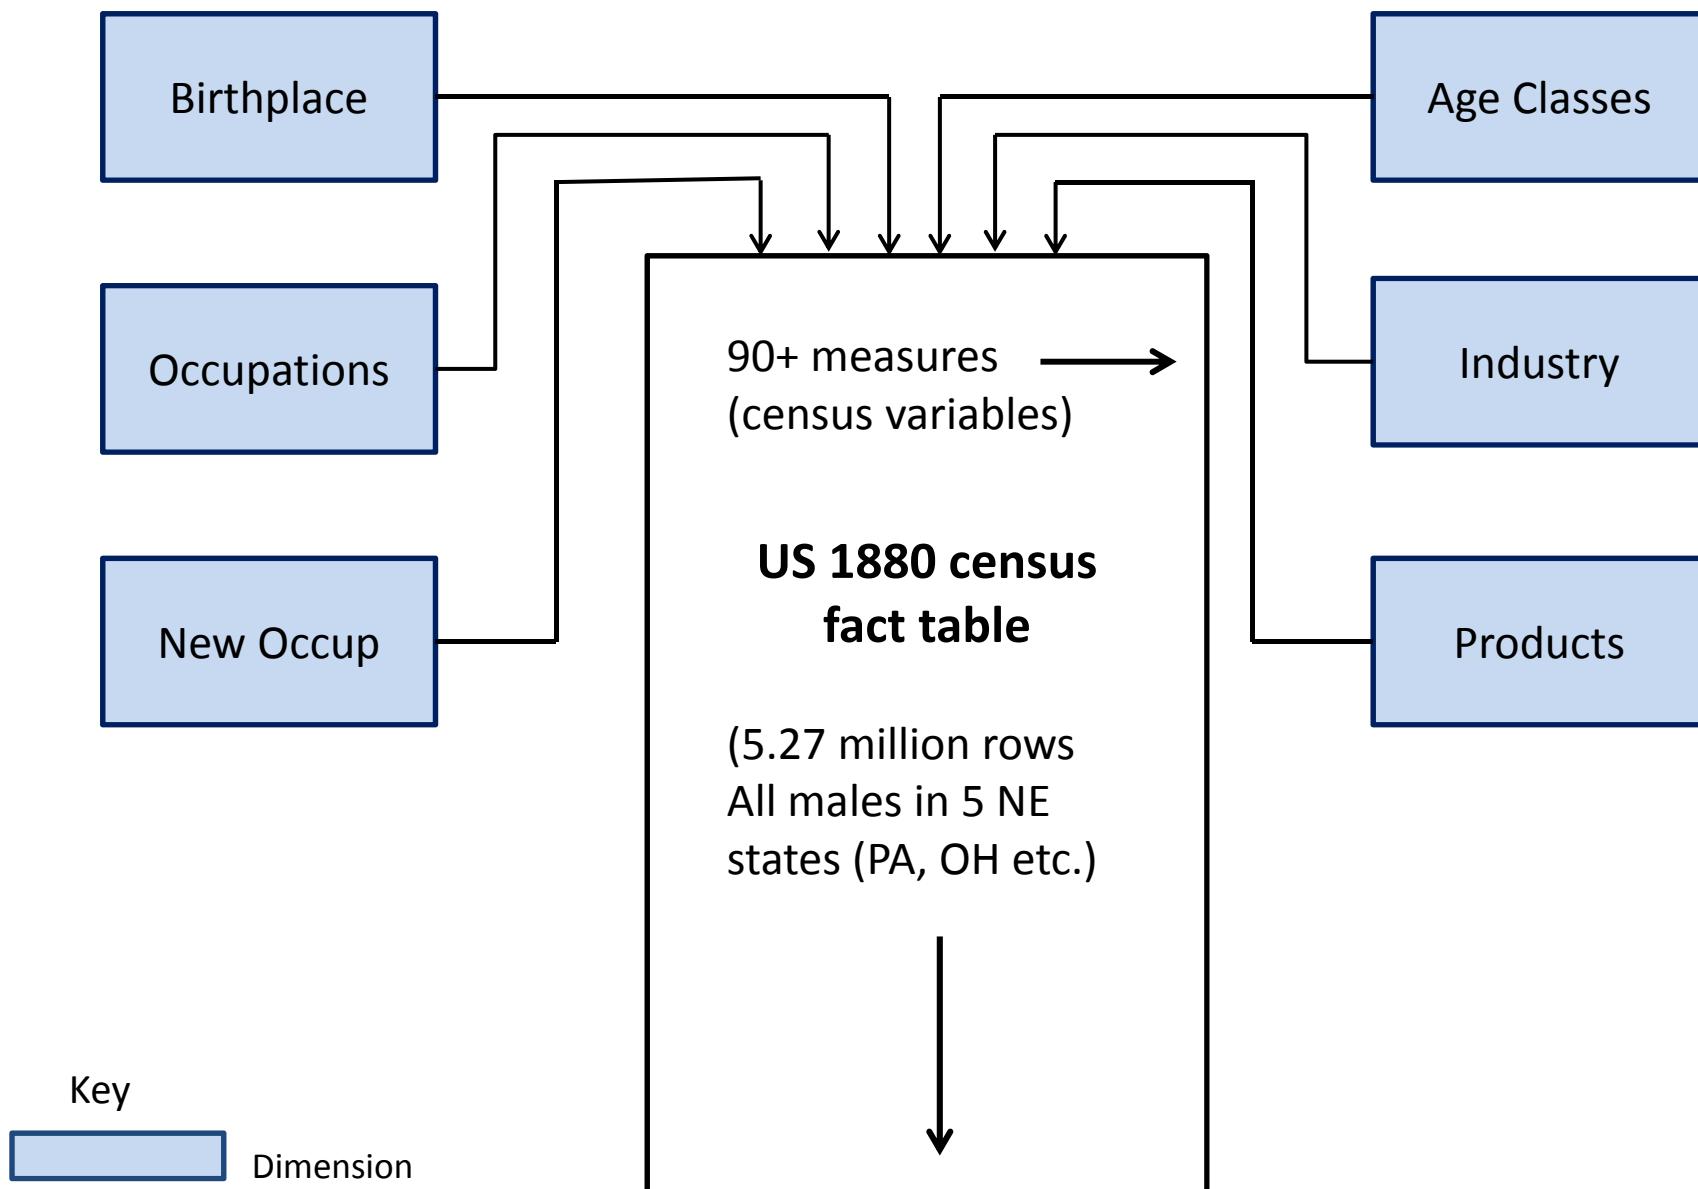

DW overview

- Designed for ‘decision support’ type applications not transaction processing
- Usually de-normalised for performance reasons
- Supports extremely large data volumes
- Employs specialised bitmap indexes to maximise performance
- Interfaces to Online-Analytical Processing (OLAP) tools to handle decision support queries

Specific Census DW structure

- *Fact/Cube* Table contains the coded individual person records
- The cube's *measures* are the census variables/attributes
- The cube is linked via database keys to a series of *dimensions*
- Dimensions are tabular representations of (often) hierarchical structures used to drive OLAP data (dis-)aggregation mechanisms

Example Codes for Anthracite Mining Occupations

Custom Tabulation Engine - System infrastructure

- Uses ORACLE DW technology, where the DW sits inside a relational database, but deploys *extensive* metadata structures to manage the DW functions.
- The OLAP operations are implemented as SQL extensions that ‘understand’ the metadata and the cube/dimension table structures
- This is known as a relational OLAP implementation
- It creates a virtual multi-dimensional data cube that can be sliced, diced, aggregated (rolled up) and drilled down, using appropriately designed queries
- Suited to exploiting availability of individual level census data where there is a desire for wide-ranging custom aggregation/data tabulation
- System can be linked to other ORACLE modules – SPATIAL, TEXT, DATA MINING to form *analytical cascade*

Example SQL query with OLAP extension

- select c.cv_county_code3,nvl(to_char(g.ctv_country_code),'Total'),
- nvl(a.nl_narrow_val_name,'Total'), count(c.low_age_val)
- from owb10_tar1.uscensus1880 c, owb10_tar1.geog_dim g,
owb10_tar1.agegroups a
- where c.cv_county_code= g.cv_county_code
- and c.low_age_val=a.low_age_val
- and c.cv_county_code3 in (4200790, 4200690, 4200030)
- group by c.cv_county_code3,
- cube(g.ctv_country_code,a.nl_narrow_val_name)

Pilot web-based system implementation

- Implemented in ORACLE PL/SQL with the following components :
 - OLAP query generation
 - OLAP query post-processing
 - Simple web interface (accesses dimensions/displays tables)
 - GIS analytical processing using ORACLE spatial functions
 - SVG graphics generator for map display and map-based OLAP query generation

Insights Relevant to E-ARK

- Tight coupling of dimension and fact table keys removes problem of data mismatches (GSI/GSO principle)
- Dimensions are ‘mini-repositories’ of valuable structures for data standardisation across database snapshots and data tables from different sources (can be used outside DW also – e.g. occupations in B&O payrolls 1842-1857)
- Time dimension less interesting for census than, for example, business records – monthly payrolls etc., but such a general purpose dimension would apply across wide range of archived tables (as would geography, industry, occupation dimensions)
- Large ‘upfront’ investment in implementing dimensions but considerable payoff as archive grows
